

Cataract Surgery After LASIK

What you need to know when previous LASIK meets today's cataract surgery

If you had LASIK years ago and are now developing cataracts, you are not alone. **The main challenge is that LASIK changed your cornea's shape, and that affects how we calculate the right lens implant power.** With modern formulas and multiple measurement devices, we achieve excellent accuracy, but the process requires extra precision.

Why LASIK Complicates This

1 Altered Corneal Shape

LASIK changed the cornea's curvature, which affects lens power calculations for cataract surgery.

2 Standard Formulas Don't Work

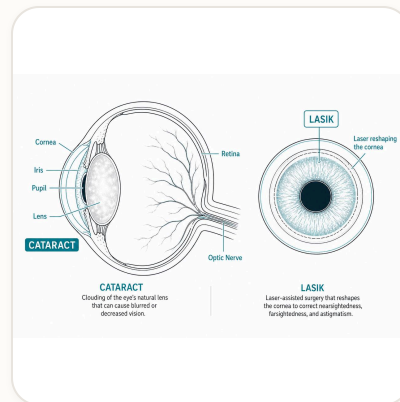

Traditional IOL formulas assume a natural cornea and get the math wrong after LASIK.

3 Historical Data Matters

Your pre-LASIK records are valuable for calculation accuracy. They provide the original corneal measurements.

4 Refractive Surprise Risk

Higher chance of needing a fine-tune after surgery. Honest planning for this possibility is part of the process.

Cataract and previous LASIK changes

How I Manage Post-LASIK Eyes

✓ Multiple Measurement Devices

Using several instruments to cross-check corneal data and reduce calculation error.

✓ Barrett True-K and Shammas Formulas

Post-LASIK-specific calculation formulas that account for altered corneal geometry. No-history methods when records are unavailable.

✓ Pentacam Posterior Corneal Measurement

Advanced imaging captures the back surface of the cornea, which standard devices miss after LASIK.

✓ Cross-Referencing Multiple Formulas

No single formula is perfect. Comparing results across methods narrows the target and improves confidence.

✓ Intraoperative Aberrometry

Real-time lens power verification during surgery for an additional layer of accuracy.

What You Should Expect

Most post-LASIK patients achieve good vision after cataract surgery. The calculations are more complex, but modern formulas and multiple measurement devices have improved accuracy significantly. If you have your original LASIK records, bring them.

Bring Your Records

If you have pre-LASIK measurements, original LASIK records, or records from your LASIK surgeon, bring them to your consultation. Historical data improves calculation accuracy.

Questions to Bring to Your Consultation

- How many post-LASIK cataract surgeries have you performed?
- Should I bring my LASIK records?
- Am I a candidate for a premium lens after LASIK?
- Which calculation methods will you use?
- What happens if my lens power needs adjustment?
- How does LASIK affect my astigmatism correction options?

Had LASIK and Now Need Cataract Surgery?

I use advanced formulas, multiple devices, and real-time verification to get your lens power right the first time.
