

Cataract Surgery with Glaucoma

How we treat both conditions in a single procedure using MIGS technology

Glaucoma and cataracts frequently occur together, and cataract surgery presents a unique opportunity. **Modern MIGS (Micro-Invasive Glaucoma Surgery) devices can be placed during cataract surgery to lower eye pressure and reduce dependence on daily drops**, all through the same tiny incision, in a single procedure.

Why Glaucoma Changes the Plan

1 Two Problems, One Opportunity

Cataract surgery is the ideal time to address glaucoma. Combining procedures means one surgery, not two.

2 Pressure Management

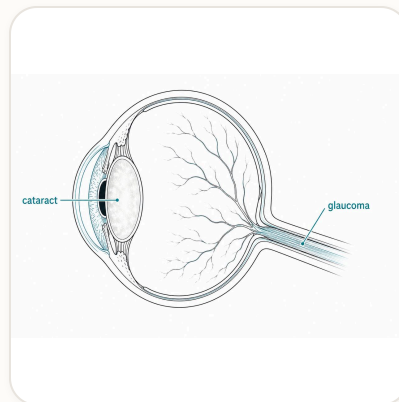

Surgery itself can lower eye pressure modestly. MIGS amplifies this effect for more meaningful reduction.

3 Medication Reduction

Many patients reduce or eliminate glaucoma eye drops after combined surgery. Fewer drops means better quality of life.

4 Monitoring Complexity

Glaucoma requires lifelong follow-up even after successful surgery. Ongoing monitoring protects your vision long-term.

Cataract and glaucoma

How I Manage These Eyes

- ✓ **iStent / iStent Inject**
Titanium micro-bypass stents for mild to moderate open-angle glaucoma. Placed during cataract surgery.
- ✓ **KDB Goniotomy**
First in the Coachella Valley to perform this procedure. Opens the eye's natural drainage channel.
- ✓ **Canaloplasty (Omni System)**
Dilates and opens the full 360 degrees of the eye's drainage canal for improved aqueous outflow.
- ✓ **Hydrus Microstent**
A scaffold that opens the drainage canal for sustained pressure reduction alongside cataract surgery.
- ✓ **Individualized Approach**
MIGS selection based on glaucoma severity, anatomy, and goals. Combined procedure means one surgery, not two.

What You Should Expect

Most patients with mild to moderate glaucoma can have their cataract and glaucoma addressed in a single procedure. The MIGS device adds minutes to the surgery but can reduce or eliminate the need for daily glaucoma drops. Results vary based on glaucoma severity.

About MIGS

Micro-Invasive Glaucoma Surgery devices are placed during cataract surgery through the same tiny incision. They work by improving the eye's natural drainage. Recovery is the same as standard cataract surgery.

Questions to Bring to Your Consultation

- Which MIGS procedure is best for my type of glaucoma?
- How will this affect my eye pressure long-term?
- Will I still need glaucoma monitoring after surgery?
- Could I reduce or stop my glaucoma drops after surgery?
- What lens options work best with my glaucoma?
- What if the MIGS device doesn't lower my pressure enough?

Glaucoma and Need Cataract Surgery?

I can address both conditions in one procedure using MIGS technology, potentially reducing or eliminating your daily drops.
