

Understanding Premium Lens Implants

Multifocal, Extended Depth of Focus, and toric lenses explained

During cataract surgery, your cloudy natural lens is replaced with an artificial lens implant. A standard monofocal lens provides excellent distance vision, but you will likely need reading glasses afterward. **Premium lens implants offer the possibility of reducing or eliminating your dependence on glasses for many activities.**

Types of Premium Lens Implants

1 Monofocal (Standard)

Provides sharp vision at one distance, usually far. Excellent optical quality with minimal visual side effects. Reading glasses will be needed.

2 Toric Lenses

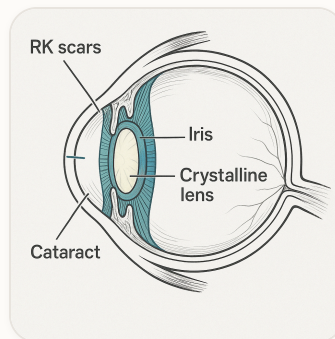

Designed for patients with astigmatism. A toric lens reduces astigmatism during cataract surgery, improving clarity without additional procedures.

3 Extended Depth of Focus (EDOF)

Stretches your range of clear vision from distance through intermediate (computer) with fewer visual side effects than multifocal lenses.

4 Multifocal Lenses

Split light into multiple focal points for distance, intermediate, and near vision. Offer the greatest glasses independence but may produce halos or glare.

The lens implant sits in the same position as your natural lens

How I Help You Choose

- ✓ **Lifestyle Assessment**
We discuss your daily activities, hobbies, and visual priorities. A golfer and an avid reader may benefit from different lenses.
- ✓ **Eye Health Screening**
Not every eye is suited for every premium lens. I evaluate your cornea, retina, and overall eye health to determine candidacy.
- ✓ **Honest Recommendations**
I will tell you clearly if a premium lens is right for your eye. Some patients are better served by a high-quality monofocal lens.
- ✓ **Realistic Expectations**
No lens eliminates glasses 100% of the time. I set realistic goals so you know exactly what to expect.
- ✓ **Precision Measurements**
Advanced biometry ensures the correct lens power for the most accurate visual result.

What You Should Expect

Premium lens implants are placed during standard cataract surgery. The procedure itself is the same. The difference is in lens selection and the visual outcome it produces. Your brain adapts to the new lens over weeks to months. Most patients notice significant improvement quickly, with continued refinement over time.

Understanding Cost

Insurance covers standard cataract surgery with a monofocal lens. Premium lenses involve an additional out-of-pocket cost because they offer features beyond basic vision correction. I believe patients deserve a clear explanation of what the upgrade provides before making that decision.

Questions to Bring to Your Consultation

- Am I a good candidate for a premium lens implant?
- Will I still need glasses for reading or computer work?
- What are the visual trade-offs with each lens type?
- What is the difference between EDOF and multifocal lenses?
- Do I have astigmatism that a toric lens could address?
- What is the additional cost, and what does it include?
