

Cataract Surgery After Radial Keratotomy (RK)

What you need to know when past RK surgery meets today's cataract care

If you had radial keratotomy (RK) years ago and are now developing cataracts, you are not alone. RK was a popular vision correction procedure in the 1980s and 1990s. It helped many people see clearly without glasses. But those incisions in the cornea never fully heal, and they create unique challenges when cataract surgery is needed. **The good news: with the right expertise and planning, excellent outcomes are absolutely achievable.**

Why RK Makes This Different

- 1 Vision That Shifts**
RK corneas change shape throughout the day, so your vision may differ morning to evening. This makes measurements more complex.
- 2 Progressive Farsightedness**
Over decades, the cornea continues to flatten along old incision lines, often shifting you toward farsightedness.
- 3 Irregular Corneal Surface**
RK incisions create an uneven cornea that standard lens formulas were not designed to handle.
- 4 Lens Calculation Difficulty**
Choosing the right lens implant power is harder in post-RK eyes than in any other category of patients.

A Rare But Important Note

In uncommon cases, the cornea can open along old RK incision lines during surgery. If this happens, sutures are placed and the surgery can still be completed. Recovery may take a bit longer, but outcomes remain good.

How Dr. Tokuhara Manages Post-RK Eyes

- ✓ **Multiple Measurements**
Different machines capture corneal data differently. Using several devices reveals the most accurate picture of your unique cornea.
- ✓ **Advanced Lens Formulas**
Specialized calculations that account for both central and surrounding corneal zones improve accuracy beyond standard formulas.
- ✓ **Real-Time Verification**
Intraoperative aberrometry measures your eye during surgery itself, giving a live check before the procedure is complete.
- ✓ **Cross-Referenced Results**
Multiple formulas compared against each other. When they agree, confidence is high. When they disagree, further analysis narrows the best choice.
- ✓ **Honest, Upfront Planning**
If fine-tuning may be needed after surgery (a lens exchange or piggyback lens), we discuss that before, not after. Planning for adjustment is smart, not a sign of failure.

What You Should Expect

Post-RK cataract surgery requires more planning and precision than a routine case. Most patients achieve excellent vision, but the path may involve more fine-tuning than it would for someone with a normal cornea. The most important thing is finding a surgeon with significant experience in post-RK eyes who will be honest with you about the process and realistic about the timeline.

? Questions to Bring to Your Consultation

- How many post-RK cataract surgeries have you performed?
- Will you use intraoperative aberrometry during my surgery?
- Do you have experience with corneal complications in RK eyes?
- Which lens calculation methods will you use for my eye?
- What happens if my lens power needs adjustment afterward?
- What type of lens implant do you recommend for my situation?
