

Cataract Surgery After Radial Keratotomy

What you need to know when past RK surgery meets today's cataract care

If you had radial keratotomy (RK) years ago and are now developing cataracts, you are not alone. RK helped many people see clearly, but those corneal incisions never fully heal. They create unique challenges for cataract surgery. **With the right expertise, good outcomes are absolutely achievable.**

Why RK Makes This Different

1 Vision That Shifts

RK corneas change shape throughout the day, making precise measurements more complex.

2 Progressive Change

Over decades, the cornea continues to flatten along old incision lines, shifting toward farsightedness.

3 Irregular Surface

RK incisions create an uneven cornea that standard lens formulas were not designed for.

4 Lens Calculation

Choosing the right implant power is harder in post-RK eyes than nearly any other cataract case.

Eye with cataract and RK scars

How I Manage Post-RK Eyes

- ✓ **Multiple Measurements**
Several devices capture the most accurate picture of your unique cornea.
- ✓ **Advanced Lens Formulas**
Specialized calculations using central and surrounding corneal zones.
- ✓ **Cross-Referenced Results**
Multiple formulas compared against each other to narrow down the best lens choice.
- ✓ **ORA (When Appropriate)**
Intraoperative aberrometry is an option, but often unreliable in RK eyes. It can be tried if requested, though results vary.
- ✓ **Honest Planning**
If fine-tuning may be needed after surgery, we discuss that upfront.

What You Should Expect

Most post-RK patients achieve good vision. The path may involve more precision and fine-tuning than a routine case. The most important thing is finding a surgeon experienced with post-RK eyes who will be honest about both the possibilities and the process.

A Note About Rare Cases

In uncommon situations, the cornea can split along old RK incision lines during surgery. Sutures are placed, the procedure is completed, and outcomes remain good. Knowing this in advance helps you feel prepared.

Questions to Bring to Your Consultation

- How many post-RK cataract surgeries have you performed?
- Will you use intraoperative aberrometry during surgery?
- Do you have experience with corneal complications in RK eyes?
- Which lens calculation methods will you use for my eye?
- What happens if my lens power needs adjustment afterward?
- What type of lens implant do you recommend for my situation?

Ready to Discuss Your Options?

Every post-RK eye is unique. A thorough evaluation is the first step toward clear vision again.
